

ESEE Knives JUNGLAS® Sheath System

The Junglas Sheath System includes an ambidextrous Kydex sheath with Cordura Backing. The Backing is shipped with four screws and posts and attached to the sheath starting with the second set of holes from the top of the sheath. There are six grommet holes in the Cordura Backing but only four are required to fasten it to the Kydex. The Cordura Backing has MOLLE compatible strapping, belt loop, 2" extender ring, pommel cover and an adjustable handle retention strap. The Cordura Backing can be removed and only the Kydex sheath used to secure your knife due to the sheath being a friction fit with adjustable tension. There are numerous grommet holes down both sides of the Kydex to enable various lashing and carry options. The entire sheath system is ambidextrous to enable left or right hand carry.

Note: Our knives are made from high carbon 1095 steel. And while 1095 is a top choice for professional cutlery designed for hard use, it will rust and stain if not properly cared for - especially on the cutting edge and around the laser engraving. It is the user's responsibility to keep the blades properly lubricated and cleaned. We suggest using a dry film rust inhibitor on the blade.
